Which is the smallest object that
you have *seen* so far?

Which is the smallest object that
you have *seen* so far?

Macroscopic : visible to the naked eye

Which is the smallest object that you *know*?

Which is the smallest object that you *know*?

Microscopic : Not visible to the naked eye

That is a fantacy!!

That is a fantacy!!

*Here is a REAL example of
miniaturization*

$$256 \text{ MB} = 256 \times 10^6 \text{ Bytes}$$
$$16 \text{ GB} = 16 \times 10^9 \text{ Bytes}$$

a byte is a unit of computer memory

It is miniaturized (reduced in size) with enhanced capacity

Miniaturization: Reduce the size without changing the properrty!

1971: Intel Transistor count 2,300 with area 12 sq. mm
2016: Intel Transistor count 7,200,000,000 within area of 456 sq. mm

In last 45 years size of a transistor has reduced drastically

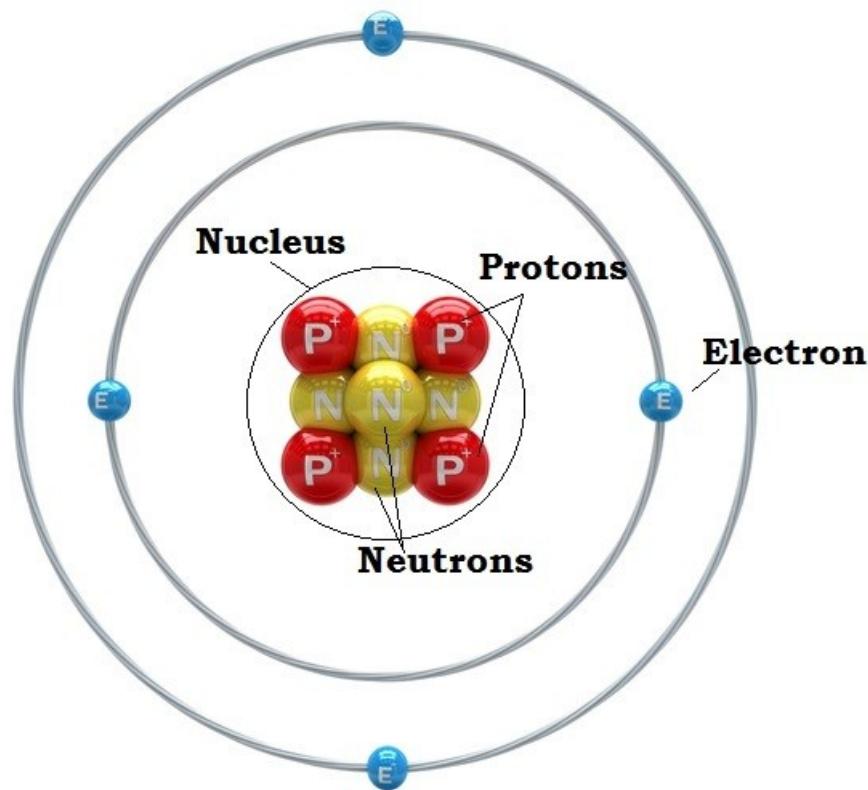

Reduce the size without
changing the property!

There is limit to this
miniaturization!!

Why?

What is *everything* made up of?

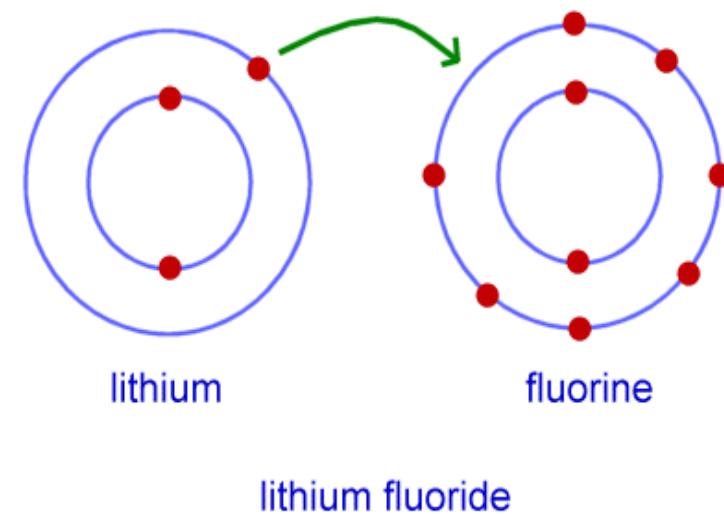

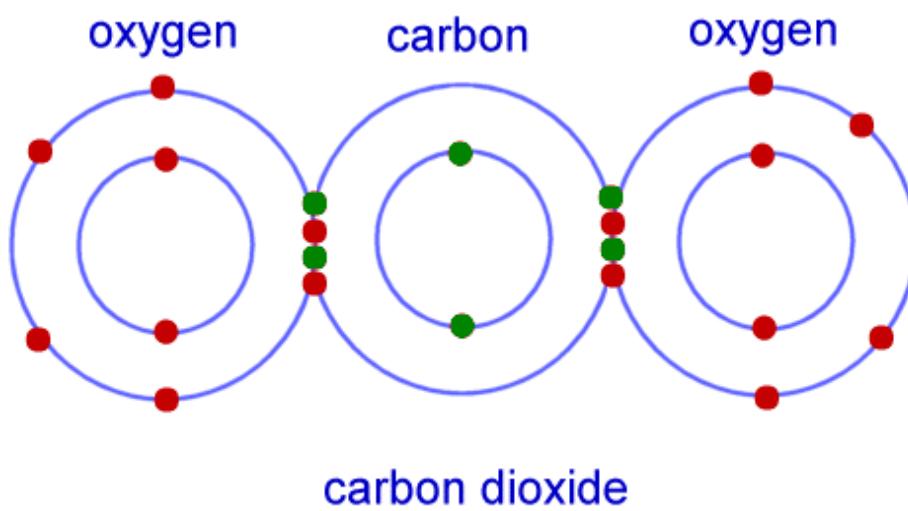

Inside an atom

How the bonds are formed?

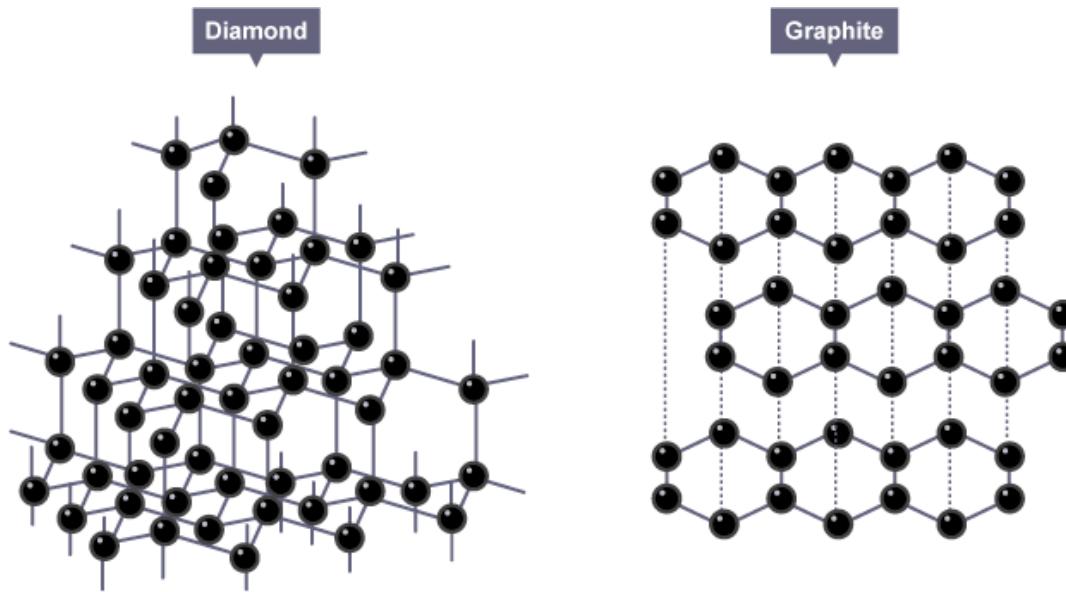

Electrons are shared
equally or unequally

Metals and Non-metals

Metals : electrons shared by all the atoms
non-directional bonds

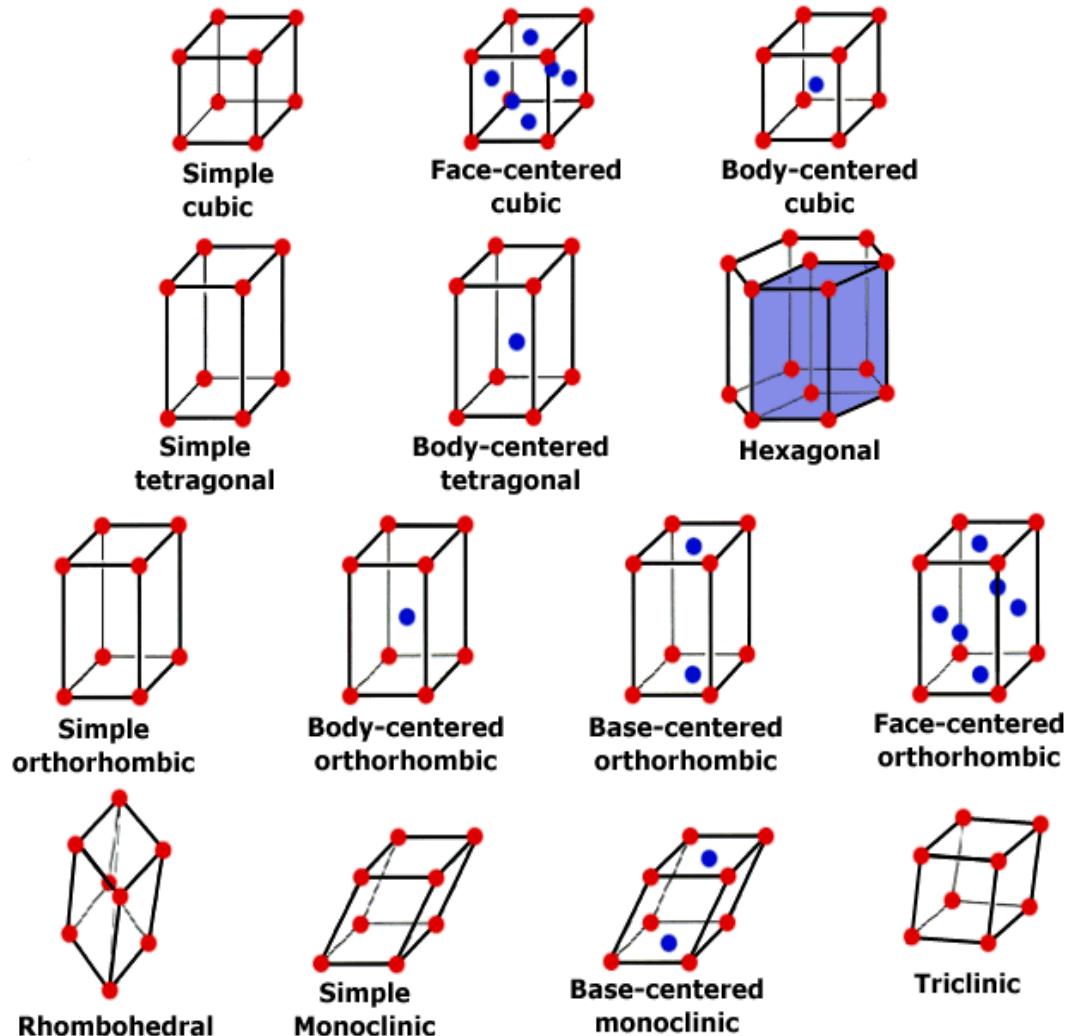

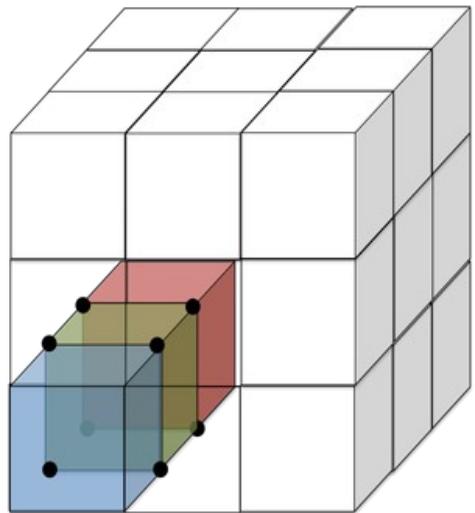

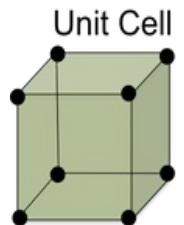

Non-metals: electrons are shared within
small group of atoms
Directional bonds

Carbon

Same element: Different structure: different bonding
drastically different properties!!

How atoms are arranged in a bulk?

What happens as the size reduces?

Atoms are no more organized in a periodic fashion

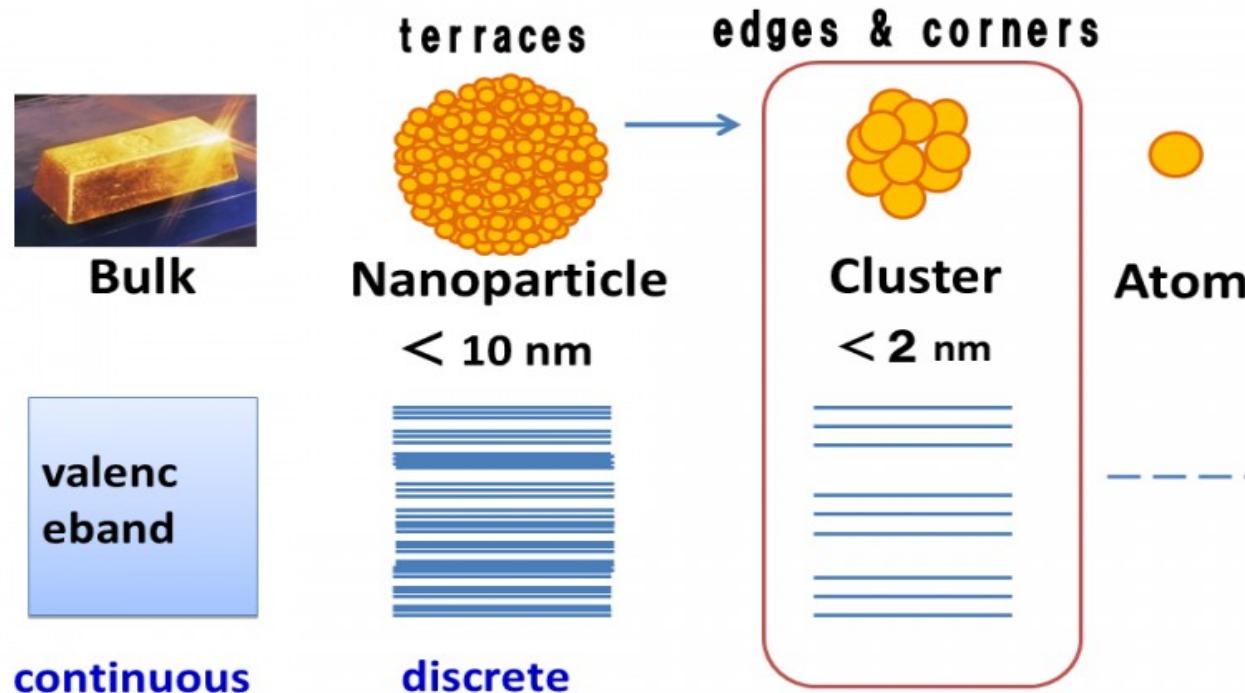

the crystal structure collapses
and this is the limit of miniaturization.

Miniaturization is possible in
scalable regime

Where the surface atoms form a very
small fraction of total number of atoms

A non-scalable regime

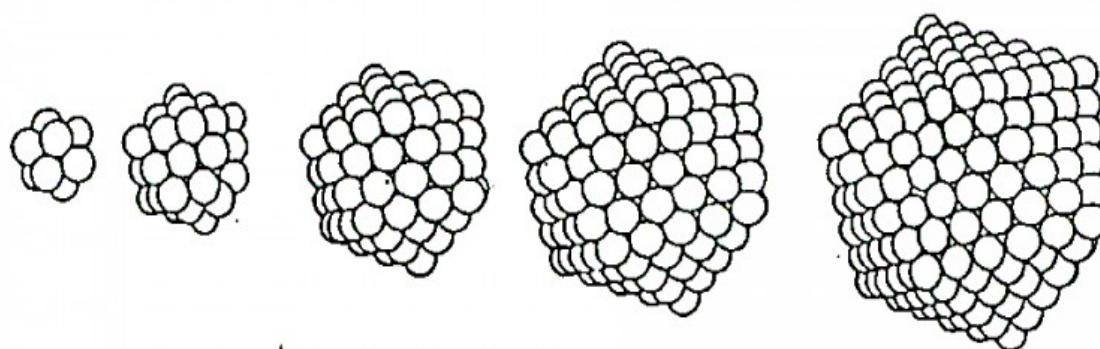

Clusters: different from bulk!
